Contact: Daniela S. Gerhard, Ph.D.

Office of Cancer Genomics
National Cancer Institute / NIH
Bldg: 31 Rml0A07 Bethesda, MD 20892
Email: cgapbs-r@mail.nih.gov
Tissue Produremnt: Dr. Michael Brownstein and Dr. Miklos Palkovits
cDNA Library Preparation: CLONTECH Laboratories, Inc.
cDNA Library Preparation: CLONTECH Laboratories, Inc.
cDNA Library Arrayed by: The I.M.A.G.E. Consortium (LLNL)
DNA Sequencing by: Agencourt Biscience Corporation
Clone distribution: MGC clone distribution information can be
found through the I.M.A.G.E. Consortium/LIML at:
Plate: NDCM195 row: n column: 02
High quality sequence stop: 553.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             meninges, duramatter, pia matter and choroid pleaus. 5, and 3, adaptors were used in cloning as follows: 5, adaptor sequence: 5'-CACGCCATTANGCC3' and 3' adaptor sequence: 5'-CACGCCATACCGACAGCCCACAGCATG-dT(30) BN-3' (where B = A, C, or G and N = A, C, G, or T). Average insert size 1.47 kb (range 0.50-4.0 kb). 15/15 colonies contained inserts by PCR. This library was enriched for full-length clones and was constructed by Clontech inboratories (Palo Alto, CA). Note: this is a NIH_MGC

The sequence contained an oligo-dr track that was present in the oligonucleotide that was used to prime the synthesis of first strand cDNA and therefore this may represent a bonafide poly A tail. The sequence tag present in the cDNA between the NotI site
                                                                                                                                                                                                                                                                                                                                                                                                                                                   1 (bases 1 to 636)

// Equal amounts of plasmid DNA from five normalized
| Libraries were mixed, and ss circles were made in vitro.
| Pollowing HAP purification; this DNA was used as tracer in a subtractive hypridization reaction. The driver was pct-amplified CDNAs from pools of 5,000 clones made from the same 5 libraries. The pools consisted of the following libraries and cloneLDs: Scares NBAFF pool 1:
| 145032-147335, 147720-148103, 148872-149255, 15002 - 154407, 151176-15237 Scares NBAFF Py pool 1:

polylinker; Site_l: Not I; Site_2: Eco RI; The UI-R-Y0
library is a subtracted library derived from an individually-tagged normalized whole-eye (minus the lens)
library. The driver for the subtraction consisted of a
pool of all previous libraries (UI-R-AU, UI-R-AI, UI-R-B0,
UI-R-EI, UI-R-C0, and UI-R-C1). The tag is a string of
UI-R-EI, UI-R-C0, and UI-R-C1). The tag is a string of
oligo-dr track which allows identification of the library
of origin of a clone within the mixture. The subtracted
library (UI-R-Y0) was constructed as follows: PCR
amplified cDNA inserts from previous library clones from
which 3' ESTS had been derived were used as a driver in a
hybridization with the normalized whole-eye library in
the form of single-stranded circles. Subtracted the labrary in
the form of single-stranded circles subtromatography, converted to
double-stranded circles and electroporated into DH10B
bacteria (Life Technolquies) to generate the UI-R-Y0
library: This procedure has been previously described
(Bonaldo, Lennon and Soares, Genome Research 6: 791-806,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            7
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The sequence tag present in the cDNA between the NotI site and the oligo-dT track served to identify it as a clone from the normalized adult Eye library. cDNA Library Preparation: M. Fatima Bonaldo. Ph.D. Clone distribution: clones will be available through Research

The sequence contained an oligo-dT track that was present in the oligonuclectide that was used to prime the synthesis of first oligonuclectide that was used to prime the synthesis of first oligonuclectide that was used to prime the synthesis of first strand cDNA and therefore this may represent a bonafide poly A strand cDNA and therefore this may represent the Norl site tail. The sequence tag present in the CDNA between the NotI site and the oligo-dT track served to identify it as a clone from the normalized 18 day embryo library CDNA Library Preparation: M.B. Soares Lab Clone distribution: clones will be available through Research Genetics (www.resgen.com)
Seq primer: MIS Forward.

```

library (UI-R-CI) was constructed as follows: PCR amplified cDNA inserts from UI-R-CO clones from which 3 ESTs had been derived was used as a driver in a hybridization with the UI-R-CO library in the form of single-stranded circles. The remaining single-stranded circles (subtracted library) was purified by
